FOREWORD

This report presents a methodology and population projections for the Iringa Region and its districts based on the 2002 Population and Housing Census data. The projection exercise was undertaken by the National Bureau of Statistics in collaboration with the Office of the Chief Government Statistician in Zanzibar as one of strategies of coordinating statistical activities in the country so as to avoid duplication of efforts in the production of official statistics.

The results include population projections of Iringa Region and its districts aggregated by sex in single years and five-year age groups; and a summary of some demographic indicators.

A successful completion of these projections was made possible by joint efforts of a number of organizations and individuals, whose participation we would like to acknowledge with gratitude. In particular we wish to recognize UNFPA for providing financial support and USAID for providing technical assistance that enabled the working sessions to be undertaken. It is noted that printing of this volume was supported by Japan International Cooperation Agency (JICA). We would also like to thank experts from the higher learning institutions in the country for their valuable technical assistance.

Finally, we would like to thank the whole National Team of Analysts: Mr. Cletus P. B. Mkai, Mr. A. M. Kaimu, Mr. S. M. Aboud, Ms. A. A. Chuwa, Mr. B. H. Amour, Mr. G. L. Ntimba, Prof. M. Mbonile, Dr. I. Ngalinda and Dr. G. M. Naimani; and Ms. A. Chuma for type setting the report. This team of analysts are particularly thanked for their commitment and active participation in the production of these projections.

We welcome any comments regarding these projections and other publications on the 2002 Population and Housing Census. They should be channelled to the Director General, National Bureau of Statistics, P. O. Box 796, Dar Es Salaam, e-mail dg@nbs.go.tz, or to the Chief Government Statistician, P. O. Box 2331 Zanzibar, e-mail zanstat@zanlink.com.

Mr. Cletus P. B. Mkai,
Director General,
National Bureau of Statistics,
Dar es Salaam.

Mr. Mohammed H. Rajab,
Chief Government Statistician,
Office of The Chief Government Statistician,
Zanzibar.

December, 2006

EXECUTIVE SUMMARY

This report presents population projections for the period 2003 to 2025 for Iringa Region and its districts. The projections were made using a Cohort Component Method (Spectrum System), whereby three components responsible for population change, namely: mortality, fertility and migration were projected separately as well as HIV/AIDS prevalence. The projected components were then applied to 2002 midyear base population in order to come up with the desired projections from 2003 to 2025.

The report gives mortality, fertility, migration and HIV/AIDS assumptions, and shows Iringa's demographic and socio-economic future trends. The results include estimated population by sex in single years and five-year age groups as well as some demographic indicators.

Population growth for the period 2003 to 2025 shows a decrease in growth rates. The projections show that population growth rate will decrease from 1.6 percent in 2003 (with a population of 1,520,891) to 0.4 percent in 2025 (with a population of 2,019,217). Sex Ratio at birth is projected to increase from 90 male births per 100 females in 2003 to 99 male births per 100 females in 2025.

Mortality estimates show that Infant Mortality Rate (IMR) is expected to decline for both sexes from 127 deaths per 1,000 live births in 2003 to 78 deaths per 1,000 live births in 2025. Under Five Mortality Rate (U5MR) for both sexes will also decline from 207 deaths per 1,000 live births in 2003 to 122 deaths per 1,000 live births in the year 2025. The mortality projected estimates further show that the life expectancy at birth for both males and females stands at 45 years in 2003. Life expectancy at birth for Iringa will decline from 45 years in 2003 to 44 years in 2025 for both sexes. For male population, life expectancy at birth will remain at the same level of 45 years in year 2003 and year 2025, while for female population the life expectancy at birth will decline from 45 years in 2003 to 43 years in 2025.

On fertility, TFR will decline from 4.9 children per woman in 2003 to 2.6 children per woman in 2025.

CHAPTER ONE: INTRODUCTION

1.1 Background

The 2002 Population and Housing Census was the fourth census to be undertaken during the post-independence period. It was carried out on 25th August 2002 with the main objective of providing accurate and reliable population data to users.

Censuses are among most important sources of demographic and socio-economic data in the country for the preparation, monitoring and evaluation of social and economic development policies such as the National Strategy for Growth and Reduction of Poverty (NSGRP) and the Zanzibar Poverty Reduction Plan (ZPRP). At the planning level, up-to-date and reliable data are essential for the formulation of realistic development plans for socio-economic development.

Evaluation of the quality of the census data is often necessary to determine whether data collection was properly done and that the data are of acceptable quality. The evaluation and quality control measures were undertaken at pre-enumeration, enumeration and post-enumeration stages. At each stage quality standards were established and maintained to minimize errors in the Population and Housing Census undertaking. This resulted in good quality data for most of the basic variables as evaluated in the 2002 Post-Enumeration Survey (PES).

This report contains the methodology used in making projections and the projection results for the Iringa Region for the period from 2003 to 2025 based on the 2002 Population and Housing Census data. It is anticipated that the projections in this report will be used by data users for monitoring and evaluating progress made towards achieving Tanzania Development Vision which ends in the year 2025 and in Zanzibar Vision 2020.

1.2 Population Projections

There are two methods of obtaining the base population for projections, namely: interpolation and extrapolation. If the desired date is between census dates, an estimate of the population can be obtained by interpolating between the two censuses. Interpolation can be done using either the same cohort or the same age groups in the census. Cohort interpolation is advisable if the age information is reliable. This interpolation technique is recommended if data are available by single ages for populations that have actual and significant age fluctuations. In addition, information on annual intercensal births is needed for determining the population of persons born during the intercensal period, thus were enumerated only in the last census.

Interpolation using the same age groups in each census is frequently used in developing countries, since information on single ages is unreliable, and the age structure usually does not have actual fluctuations. The procedure is acceptable, particularly when the interpolation date is close to the census date. The interpolation can be made either linearly or exponentially. If the desired date is close to one of the census date, both possibilities give similar results. But, if the interpolation date is several years distant from the

census date, linear interpolation produces higher values than exponential. In most cases, the exponential interpolation is more suitable than the linear interpolation.

Another procedure for adjusting the population is to shift or move the population from a given date (for instance, a census date) to another date (for instance midyear). If the total population for desired date is available, extrapolation can be used. Another possibility is to use the levels of mortality, fertility and migration to estimate the population growth rate, and then use the growth rate to calculate the total population at the desired date. Once the new total has been calculated, the age structure can be adjusted proportionately to the new total. The base population used for projections was based on extrapolated population taking into consideration the levels of mortality, fertility, migration and HIV/AIDS.

1.3 The Population Projection Software

The population projection software used for this projection is the Spectrum System which is a computer package that analyses existing information to determine the future consequences of today's development programs and policies. Spectrum is a Windows-based system of integrated policy models. The integration is based on Demographic Projection (DemProj), which is used to create the population projections that support many of the calculations in the other components, such as AIDS Impact Model (AIM).

The DemProj, is a computer program for making population projections for countries or regions. The program requires information on the number of people by age and sex in the base year, as well as current year data and future assumptions about the Total Fertility Rate (TFR), the age distribution of fertility, life expectancy at birth by sex, the most appropriate model life table, and the magnitude and pattern of international migration.

This information is used to project the size of the future population by age and sex for many years into the future. If desired, the projection can also estimate the size of the urban and rural populations. Linking DemProj with other modules in Spectrum makes it possible to examine the demographic impact of AIDS.

DemProj was first produced in 1980. Since then, it has been used by a large number of planners and researchers around the world. It has been updated from time to time in response to comments and suggestions from users. The DemProj 4, incorporates a number of new features in response to these comments.

The demographic projection is modified by AIM through AIDS deaths and the impact of HIV infection on fertility. A demographic projection must be prepared first, before AIM can be used.

AIM is a computer program for projecting the impact of the AIDS epidemic. This program projects the future number of HIV infections, AIDS cases, and AIDS deaths, given an assumption about adult HIV prevalence. It can also project the demographic and social impacts of AIDS including the number of people needing treatment and the number of orphans.

AIM requires an assumption about the future course of adult HIV prevalence. Assumptions about other HIV/AIDS characteristics can also be entered for such variables as the survival period from HIV infection to AIDS death, the age and sex distribution of infections, and the Perinatal Transmission Rate. The Epidemiology section of AIM calculates the number of HIV infections, AIDS cases, and AIDS deaths.

HIV/AIDS projections illustrate the magnitude of the AIDS epidemic and the demographic, social and economic consequences. This illustration also shows policymakers the impacts on other areas of development and the size of the impacts that could be expected without effective action. HIV/AIDS projections are also needed to plan the response. For example, AIM can project the number of people needing anti-retroviral therapy, which can serve as the basis for planning expanded access to treatment. It can be used to estimate the number of orphans in order to develop support programs.

AIM requires data describing the characteristics of the HIV/AIDS epidemic and the response to it. Some of these data (e.g., adult HIV prevalence) must be specific for the area being studied, whereas others (e.g., the mother-to-child transmission rate) can be based either on local data or on international averages when local data are unavailable.

CHAPTER TWO: PROJECTION ASSUMPTIONS

2.1 Base Population

Population projections require a base population that is distributed by age and sex. The 2002 Population and Housing Census night was on 25th August 2002, the population therefore had to be adjusted to midyear in order to obtain the base population for the projection.

The generated base population figures were obtained by smoothing population ages 10 years and over and adjusting population under age 10 consistently with fertility and mortality. This was done by applying the BASEPOP.XLS spreadsheet.

The following inputs were used to obtain the base population:

- Reported population distributed by five year age-groups and sex was obtained from the 2002 Population and Housing Census.
- Sex ratio at birth (male births per 100 female births) was assumed to be 103.
- Mortality data at two points in time that is earlier (1988) and later (2002) these are nL_x values for males and females.
- Earlier and later date fertility data were Age Specific Fertility Rates (ASFRs) from the 1991/92 and 2004/05 TDHS. This is due to the fact that TDHS provides more reliable fertility information compared with census. Furthermore, TDHS fertility data collection is based on birth history of individual women.

The next step was to move the population to a desired point in time (mid-year of 2002) using population growth rate based on estimated fertility and mortality. This provided the adjusted population estimates by using MOVEPOP spreadsheets.

The inputs used in the MOVEPOP were:

- Adjusted Population disaggregated by five-year age groups and sex was generated from BASEPOP.XLS spreadsheets.
- Age-Specific Central Death Rates - $M(x)$ – these estimates were generated from LTPOPDTH.XLS spreadsheets.
- Age-Specific Fertility Rate - the same as those applied in BASEPOP.XLS spreadsheets

2.2 Mortality Assumptions

2.2.1 Introduction

Population projections are affected by several factors including Infant Mortality Rate (IMR), Under Five Mortality Rate (U5MR), Crude Death Rate (CDR) and Life expectancy at birth. Application of any index depends mainly on the availability of information or the requirement of models to be used in the exercise. In all mortality indices, life expectancy at birth is considered to be more appropriate as an input for population projection.

Considering strategies, which are being taken under recent national and international programmes such as NSGRP, Millennium Development Goals (MDG's) and ZPRP, it is expected that life expectancy will improve. Some of the outcome of the Strategies includes:

- a rise in level of education
- improved social services including health facilities; and
- increase in per capita income.

These and other strategies have direct impact in reducing both child and adult mortality. Furthermore, in the health sector there are a number of interventions like Prevention from Mother to Child Transmission of HIV and prolonging the life of HIV infected population by using Anti-Retrovirals (ARVs). Also immunization coverage is expected to improve leading to reduced child mortality.

2.2.2 Assumptions

Despite a large amount of available Census data for mortality estimates, generally in developing world, it is known that mortality information derived from censuses has all along been inadequate. The most reliable data for mortality estimates are obtained from registration of deaths for countries where vital registration systems are in place. However, Tanzania, like many countries in sub-Saharan Africa does not have a vital registration system that provides information of the required quality for reliable mortality estimates. Errors in the number of deaths reported through the 2002 Population and Housing Census in Tanzania were due to the:

- reluctance of respondents to talk about recent dead relatives;
- inability of respondents to remember dates of deaths;
- misinterpretation of the past one year to be the same as the previous calendar year; and
- break-up of a household as a result of the death of the head of household.

To get desired mortality levels, the quality of data was evaluated by using the Growth Balance Technique and the Preston-Coale Technique. The growth balance technique estimates the completeness of reporting the deaths of over age 5 by comparing the age distribution of deaths to get the age distribution of population. It provides information on the quality of death data and permits an adjustment in cases where the population meets the assumptions. For the 2002 census, adjustment of the data was done by using the spreadsheet namely *LTPOPDTH.XLS* for males and females to generate central mortality rates and life expectancy at birth. Life expectancy at birth was projected between year 2003 and 2025 using *E0PRJ.XLS* Spread Sheet. The mortality assumptions for Iringa are summarized in Table 1.

Table 1: Iringa Region Mortality Assumptions - Life Expectancy at Birth (2002 – 2025)

Year	Males	Females
2002	48.0	46.0
2003	48.9	48.0
2004	49.8	49.9
2005	50.7	51.9
2006	51.1	52.3
2007	51.5	52.7
2008	51.8	53.2
2009	52.2	53.6
2010	52.6	54.0
2011	53.0	54.4
2012	53.3	54.8
2013	53.7	55.3
2014	54.0	55.7
2015	54.4	56.1
2016	54.8	56.5
2017	55.2	57.0
2018	55.5	57.4
2019	55.9	57.9
2020	56.3	58.3
2021	56.7	58.7
2022	57.0	59.1
2023	57.4	59.6
2024	57.7	60.0
2025	58.1	60.4

2.3 Fertility Assumptions

2.3.1 Introduction

The 2002 Population and Housing Census in Tanzania provided two sources from which fertility indices were derived. These include a question directed to women of age 12 and above regarding whether they had given birth to a child or not during the last 12 months prior to the census date. This information was used to obtain the current fertility. Another question also asked to women of age 12 and above was related to the total number of children born alive that they had ever had. This provided information on the average number of children born alive by age group of women and in the case of women who had passed their reproductive age, the average size of completed families. Apart from the census data, fertility data can also be obtained from demographic sample surveys.

2.3.2 Assumptions

Fertility as one of the components of population change has shown an indication of decreasing slightly over the last decade or so. The sex ratio at birth was assumed to be 103 males per 100 females.

However, the fertility patterns obtained using censuses data were found to be on the high side in comparison with TDHS results. In view of this, fertility data from the TDHS of 1991/92, 1996 and 2004/05 were used. This is due to the fact that TDHS provides more reliable fertility results than censuses.

Trends in fertility patterns for the period from 2003 to 2025 were then generated using the spreadsheet that interpolates and extrapolates total fertility rates known as **TFRLGST.XLS**. Fertility assumptions for Iringa are summarized in Table 2

Table 2: Iringa Region Fertility (TFR) Assumptions (2002-2025)

Year	TFR
2002	5.0
2003	4.9
2004	4.8
2005	4.6
2006	4.5
2007	4.4
2008	4.2
2009	4.1
2010	4.0
2011	3.8
2012	3.7
2013	3.6
2014	3.5
2015	3.4
2016	3.3
2017	3.2
2018	3.1
2019	3.0
2020	2.9
2021	2.8
2022	2.8
2023	2.7
2024	2.6
2025	2.6

2.4 Migration Assumptions

2.4.1 Introduction

Inclusion of migration assumptions in population projections is important because it is one of the major components of population dynamics. The other components of population change are fertility and mortality. There are two types of migration data that are considered in population projections i.e. internal migration and international migration data.

Internal migration data is used in regional or district population projections because it does not change the total population of the country. Meanwhile, international migration data is used at national level population projections because it involves crossing national boundaries that change the population of the respective countries.

Generally, migration data from the census are obtained from the questions on the place of birth and residence. However, data of foreign-born population might be valuable for measuring migration when data on place of birth and residence are lacking. Measurement of the volume of immigrants can be obtained from census data, but the volume of emigrants cannot be captured in the census. Due to lack of emigration

data in the census, data from Immigration Department of the Ministry of Home Affairs were outsourced for the projection.

2.4.2 Assumptions

Migration projection normally considers three separate sources of data – net internal migration, refugee movements and non-refugee international migration.

For internal migration, it is a fact that internal migrants were already included in the regional populations. Therefore, the assumption on internal migration is that the situation found during the 2002 census concerning internal movements will prevail for the entire population projection period.

2.5 HIV/AIDS Assumptions

2.5.1 Introduction

In Tanzania the first HIV/AIDS cases were clinically diagnosed and reported in 1983 in Kagera region. It was then followed by a rapid spread of the pandemic to the extent that by 1986 all regions of the Tanzania Mainland had reported HIV/AIDS cases. According to a report published by National Aids Control Programme (NACP) in the Ministry of Health in 2004, it was estimated that by year 2003 there were about 1.8 million people living with HIV/AIDS. The data were based on pregnant women attending Ante Natal Clinics and STI/ HIV/AIDS Surveillance data. However, in 2003/04 Tanzania HIV/AIDS Indicator Survey (THIS) was conducted by the National Bureau of Statistics in collaboration with the Tanzania Commission for AIDS Ministry of Health and USAID. This was the first household based survey conducted in Tanzania Mainland. The prevalence rates estimated from THIS were used to generate an input for HIV/AIDS projection.

The Demographic Impact of AIDS (AIM) projection as explained in section 1.3 above requires an estimate of future levels of HIV prevalence. Usually AIM is used to illustrate the future consequences of an epidemic. Therefore, AIM is used with plausible projections of future prevalence to show what would happen if prevalence followed the indicated path. In this case it is only necessary to have a plausible projection. Various approaches and tools outside of the Spectrum system are available to make HIV prevalence projections. The approach used in this projection was the Epidemic Projection Package (EPP).

EPP is a software that assists in making estimates and projections on HIV. Generally EPP can be used to model prevalence even below one percent. It just requires a sufficient number of data points to estimate a reliable trend. In its present form, EPP is meant to model generalized epidemics only. This software was used to assist in incorporating HIV/AIDS assumption into population projection based on the 2002 Census. The HIV/AIDS input data for the EPP was obtained from the Sentinel Surveillance data available in the Ministry of Health and the 2003/04 Tanzania HIV/AIDS Indicator Survey.

2.5.2 Assumptions

The HIV/AIDS Surveillance data from the Ministry of Health were used to observe the trend for both concentrated and generalized forms of HIV prevalence. Modeling through use of the EPP estimates along with epidemiological assumptions about the HIV epidemic were used to estimate AIDS mortality that were inputs for the AIM. Thus the HIV/AIDS assumptions for the projections are as follows:

- Incidence was presumed to be 50 percent of the relative 2010 estimated level by 2025.
- Anti-retroviral coverage was presumed to be zero percent before 2005 but 20 percent of new AIDS cases from 2005 to 2025
- For years 2005 to 2010 a more or less stable epidemic of about 13.4 percent was assumed.

Input for HIV prevalence for Iringa was 13.4 percent according to the 2004 Tanzania HIV Indicator Survey.

2.5.3 District Assumptions

The generated base population figures at district level were obtained by smoothing population age 10 years and over and adjusting population under age 10 consistently with fertility and mortality. This was done by applying the BASEPOP.XLS spreadsheet.

Regional assumptions of fertility, mortality, migration and HIV/AIDS were used to project district population from 2003 to 2025

CHAPTER THREE: PROJECTIONS

3.1 Introduction

Information presented in this chapter include: projected total population of Iringa Region by sex in single and five-year age groups as well as summary of demographic indicators derived by using Spectrum Software.

3.2 Highlights of Population Projections Results for Iringa

This section discusses all demographic indicators for midyear population between 2003 and 2025.

3.2.1 Population Growth

The projections show that population growth rate will decrease from 1.6 percent in 2003 (with a population of 1,520,891) to 0.4 percent in 2025 (with a population of 2,019,217).

3.2.2 Life Expectancy at Birth

Life expectancy at birth for Iringa will decline from 45 years in 2003 to 44 years in 2025 for both sexes. For male population life expectancy at birth will remain at the same level of 45 years in year 2003 and 2025 while for female population the life expectancy at birth will decline from 45 years in 2003 to 43 years in 2025.

3.2.3 Infant and Under five Mortality

The Infant Mortality Rate (IMR) is expected to decline for both sexes from 127 deaths per 1,000 live births in 2003 to 78 deaths per 1,000 live births in 2025. Under five mortality Rate (U5MR) for both sexes will also decline from 207 deaths per 1,000 live births in 2003 to 122 deaths per 1,000 live births in the year 2025.

3.2.4 Total Fertility Rate (TFR)

The projected TFR in 2003 is 4.9 children per woman and 2.6 children per woman in 2025.

3.3 Detailed Projections

The projection results for the Iringa Region and its districts are presented in Table 3 to Table 7 below.

Table 3: Summary of Demographic Indicators

Indicators	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
Fertility											
TFR	4.89	4.76	4.63	4.49	4.36	4.23	4.10	3.97	3.84	3.72	3.60

Annex: Explanatory Notes on Population Analysis Spreadsheets (PAS)

The Population Analysis Spreadsheet (PAS) system is a set of Lotus 1-2-3 spreadsheets that have been created to help in analyzing demographic data and preparing for population projections. The PAS system consists of two parts: (a) the set of spreadsheets for demographic analysis and (b) the PAS menu, a special Lotus spreadsheet with macros for facilitating the use of the spreadsheets.

In constructing Tanzania National Population Projections, the following spreadsheets were used;

- BASEPOP.XLS; The spreadsheet estimates a smoothed population ages 10 years and over and adjusted population under age 10 years using the smoothed population and estimates of fertility and mortality. The population can then be adjusted to a desired total (by sex if available). The population is smoothed using Arriaga method to split 10-year age groups into 5-year groups.
- E0LGST.XLS; This spreadsheet interpolates and extrapolates life expectancies at birth, by sex. The program fits a logistic function using 2 to 17 life expectancies at birth, given the values of upper and lower asymptotes.
- LTPOPDTH; This spreadsheet computes a life table from deaths and population by age and has an option for using an independently calculated or estimated infant mortality rate. It also produces a life table based on central (**mx**) values smoothed by a moving average of the logarithms.
- MOVEPOP; The spreadsheet estimates the population by age and sex for a desired date. The total population at the desired date is derived based on the reported population at a specified date, age-specific central death rates by sex, age-specific fertility rates, and the annual net number of migrants. The population by age and sex is then proportionally adjusted to the total population at the desired date.
- TFRLGST; The spreadsheet interpolates and extrapolates total fertility rates (TFR). The program fits a logistic function using 2 to 17 total fertility rates, given the values of upper and lower asymptotes. The beginning date for displaying the results is also entered.
- EPP; File; This software is intended to assist those responsible for making estimates and projections for HIV in organizing their data and preparing short term projections for HIV.
